SIGN UP FOR THE PROMISE REGISTRY. HELP YOURSELF, HELP YOUR FAMILY, HELP OTHER P CA FIGHTERS.

PROMISE Registry

The PROMISE registry is an observational study intended to bring a personalized approach to prostate cancer treatments and therapies. PROMISE research will examine how particular genetic profiles can:

- Influence the susceptibility of men to prostate cancer
- Impact the effectiveness of existing treatments
- Improve guidance for different and/or new treatment options
- Suggest precise areas to explore for new discoveries

According to Heather Cheng, MD, PhD, University of Washington, and Channing Paller, MD, Johns Hopkins University, lead investigators of PROMISE, prostate cancer may be written in some men's genes, but so are instructions for discovering new treatments and understanding family risk.

Seeking Your Help

PROMISE researchers are looking to identify prostate cancer patients ages 18+ with specific inherited genetic factors using a saliva DNA test. Participation is simple and there is no cost. Patients remain under the care of their current doctor. No travel is required. Patients don't need to leave home.

Benefits of Joining the PROMISE Registry

Prostate cancer patients who join PROMISE will:

- Learn valuable information about their genetic profile and discover if they have a critical gene mutation that may impact their personalized care plan.
- Receive the most current information about new research, clinical trial opportunities, and treatments approved by the FDA.
- Help family members understand their own risk of prostate cancer and risk for future generations.
- Make an essential contribution to advancing research and understanding of prostate cancer by providing essential genetic information and long-term outcomes that are not available anywhere else.
