## **CRISPR: A NEW FRONTIER FOR GENETICALLY-DRIVEN CANCER TREATMENT**

Scientists are making great strides when it comes to the gene editing technique known as CRISPR. CRISPR is short for “*clustered regularly interspaced short palindromic repeats*,” and this technology is now being widely used in scientific laboratories. CRISPR technology works by finding a specific bit of DNA inside a cell, and then altering that piece of DNA. Taking out just certain DNA molecules and replacing them with genetic material that goes after the cancer is the basis of the CRISPR method. Scientists are confident that the treatment and prevention of prostate cancer using CRISPR technique holds tremendous potential. Stay tuned, as this technology is just getting started.
